

# See where your time **actually** goes.

A personal time-management cockpit that turns your day into a real, finite budget of minutes — and stops work from quietly overflowing the time you thought was free.

## THE PROBLEM

# To-do lists hide the math.

A list that looks achievable, an illusion of free time, and work that spills over — because nothing ever counted the hours against a real budget.

### Invisible time

Meetings, interruptions and "quick" tasks vanish from your sense of the day.

### Silent overflow

Plans look fine until 9pm. Nothing warned you the day was already full.

### No feedback loop

Estimates never get tested against reality, so they never improve.

## THE CORE IDEA

# Your day is a budget, not a list.

- 1 Set your routine once.** Sleep, commute, work hours and working days are subtracted to compute the time you really have.
- 2 Every task carries an estimate.** A live timer logs real minutes against it as you work.
- 3 The cockpit shows allocated vs available,** flags overflow the moment your plan exceeds the budget, and tracks planned vs actual.

Calendar events, chores and interruptions all draw from the same budget  
— so the number you see is the truth, not a wish.

Today · the cockpit

# Your daily command center.

## Time Budget

Available · Allocated · Interrupted, across Day / Week / Month — with a live "time gained vs plan".

## 24-Hour Allocation

A ring of where the day went, plus a "Today by area" breakdown.

## Live timers

Per-task estimates with concurrent timers — start, pause (time kept), stop & complete.

## Pending & Scheduled

Overdue carry-over and future tasks, with soft / hard deadlines and overflow detection.

TODAY • DAY PLAN

# Drag your day onto a clock.

Open the Day plan to place today's tasks on an hour-by-hour timeline. Drag to move, drag the edge to resize (15-minute snaps), drop unscheduled work into the first free slot. Overlaps flag red; Google events are fixed bands you plan around.

## Timebox

Turn a budget into an actual schedule.

## Chores block

Small 5/10/15-min items batch into one timed end-of-day block that carries forward.

## Completed ledger

Reopen a task or correct its logged time, even after it's done.

## Goals

# Goals that track themselves.

A real hierarchy — Annual → Half-year → Monthly → Weekly — where progress is **derived from the tasks you link**, not a slider you nudge.

### Count goals

Progress = completed linked tasks toward a target (e.g. "ship 3 posts").

### Timed goals

A hard deadline; lapses to "missed" if it passes under target.

### Conclude • Duplicate

Close any goal at a chosen %, or one-click the next period's recurring copy.

Calendar

# Meetings count too.

Day / Week / Month views of your tasks and events. Connect **Google Calendar** (multi-account, read-only) and synced events become budget-deducting blocks you plan around.

## Month

Cells tinted by dominant area, event chips, per-area bars, overflow flags.

## Week & Day

A 7-day breakdown and a read-only day detail with completed-task history.

## Google sync

Real meetings deduct from the budget; mute any recurring series you don't want counted.

WHAT MAKES IT DIFFERENT

# Three things most apps miss.

## One-tap interruptions

Log what derailed you instantly — 🔥 Fire, 🌀 Rabbit Hole, 😵‍💫 Distraction. Lost time becomes visible time.

## Function Tracks

Organise work by the function it serves inside each venture, not a flat project list.

## Delegation tracker

First-class accounting of work handed off — "I delegated it" never means "I lost it".

## Team & Delegation

# Keep handed-off work in sight.

- › **By Person** — an attention-sorted rail with each person's open items, status counts and history.
- › **By Status** — a board across Pending / In progress / Done / Blocked.
- › **Follow-ups due** — surfaces what needs chasing, with overdue / blocked / this-week filters and search.

## Reports

# Look back. Get honest.

## Statistics

Over any range: time per area, pace (logged vs estimate), deadline adherence, completed & missed goals, delegation history, effort trend.

## Task history

The raw ledger — date-filtered (last 7 days by default), searchable, with created / completed / logged and a ↩ Reverse on any completion.

Pace turns your estimates into a feedback loop: see where you beat, hit, or blew the plan — and calibrate.

## HOW TO USE IT

# Up and running in four steps.

- 1 Set your routine** — sleep, commute, work, working days. That's what makes 24 hours into your real available time.
- 2 Add tasks with estimates** — pick the area, a function track, a deadline, and (optionally) link a weekly goal.
- 3 Run the day from Today** — start timers, plan on the timeline, log interruptions, tick off chores.
- 4 Review in Reports** — see where time went and tighten your estimates for next week.

Tip: try "Explore in demo mode" on the login screen for a fully populated sample day.

UNDER THE HOOD

# Fast, installable, yours.

## Frontend

React + TypeScript PWA (Vite). Installable; budget math and timers run client-side.

## Backend

Express + TypeScript, Mongoose on MongoDB Atlas, JWT — every record scoped to you.

## Hosting

Vercel: static client on the CDN, the whole API as one serverless function.

Wrapped in a frosted "liquid glass" UI over swappable wallpapers — light, playful, and calm to live in all day.

DAYFORGE

**Stop guessing where the day went.**  
**Forge it.**

Know where your time actually goes.
